TODO

Code

0. Add tests
1. Create "factory" class, simple and stupid as possible that allows us to create ingredients.
2. Create ingredients stash, or some container designed to keep them. First: for herb example
3. Create tool to process the herbs (**note: Keep in mind decision if we need tools factory or if tools should be added by hardcoding**)
4. Create basic **product**
5. Create **procedure** to create **product**
6. Add some processor or **workbench** that will get the stuff: **procedure**, **tool**, **ingredients (in stash)** and will create **product**

Repo

1. Prepare some rules on merging branches
2. Prepare some checks
3. Configure github actions
